CCSA104 Practical Assignment: Managing Security Policies

Course: CCSA104 Security Policy Management (2 credit units) · Companion to Lab 4A: Manage the Security Policies · Total: 100 marks (Practical 70, Theory 30)

Student name	Abdussamad Alhassan	**Student ID**	**C11/26/CCSA/17043**
Date	7/11/2026	**Score**	/ 100

Policy package in use is standard

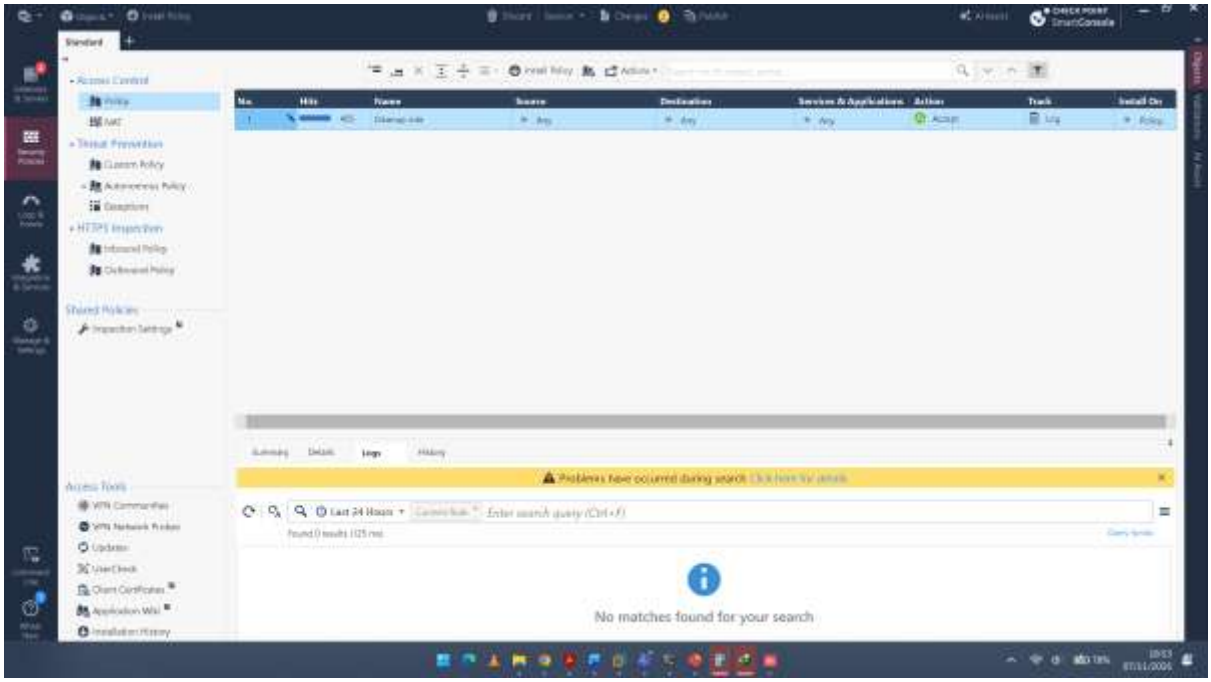

2. Cleanup rule

Name: Cleanup rule

Source, Destination, services and applications: any, any, any

Action: accept

Track: Log
Install on : policy targets

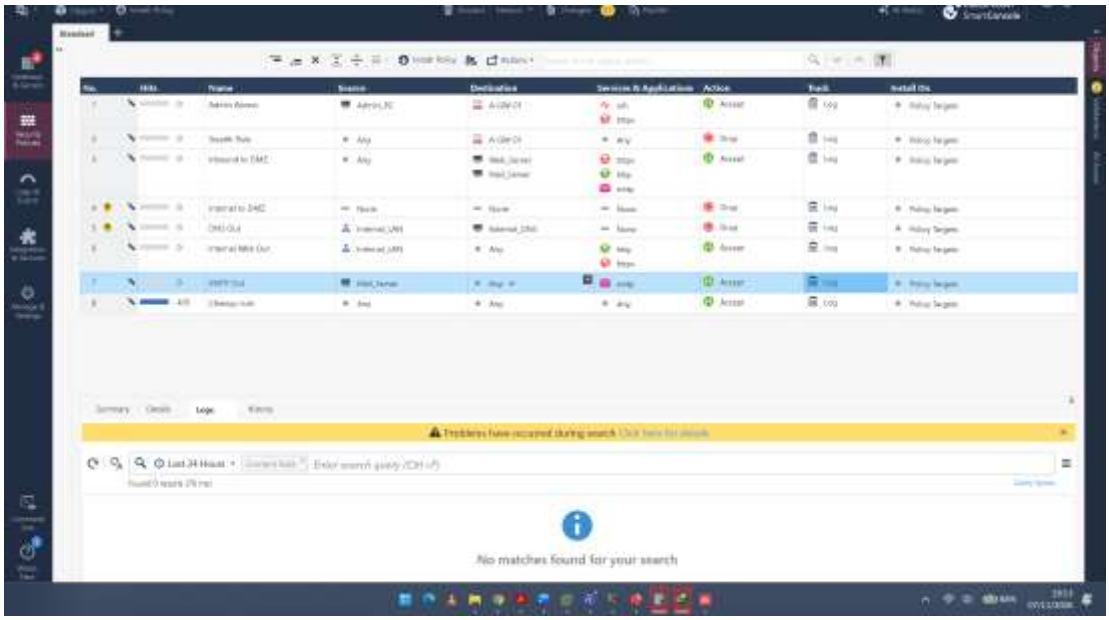

Hits track and install

Three categories that can be found are :
Firewall

Logging and Status

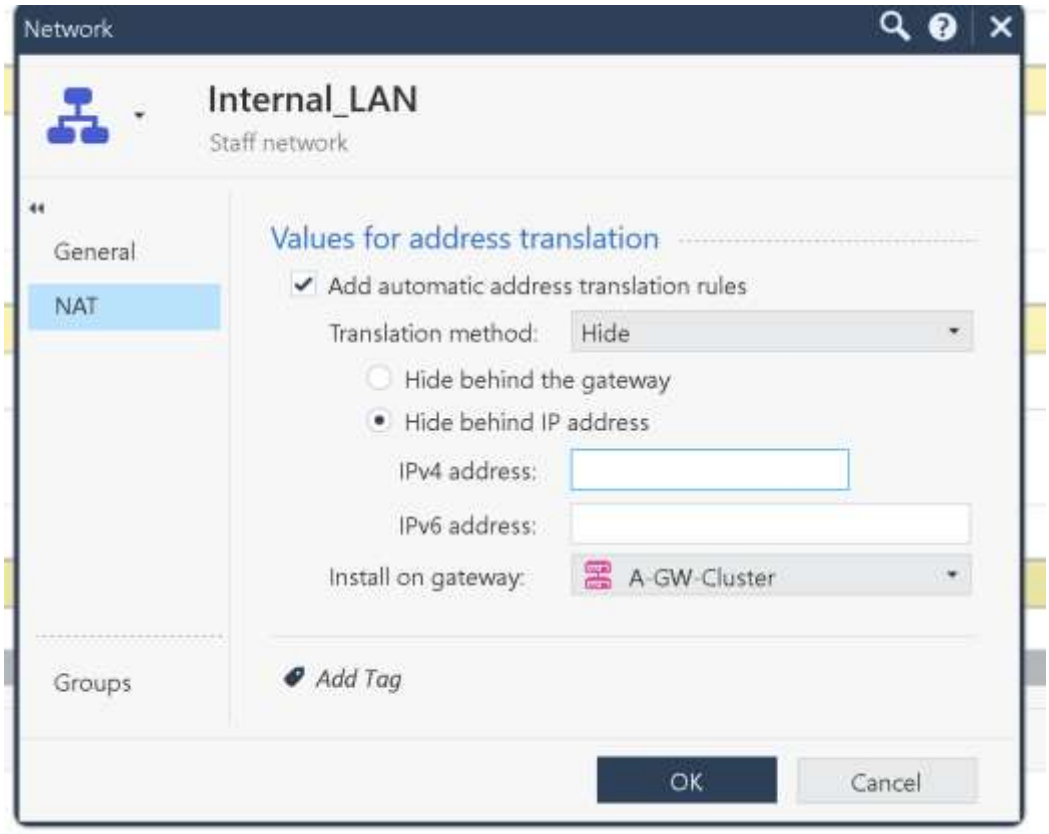

NAT

Rule creation

Task 6

Configuring NAT on Internal_LAN

Part B: Theory Questions

Q1: B

Q2: A

Q3: C

Q4: D

Q5: B

Section B2

Q6

Explicit rules are the ones you create yourself in the Security Policy rulebase to control traffic.

Implied rules are generated automatically by Check Point based on your system settings and security needs.

You configure implied rules under Global Properties → Firewall → Implied Rules. Depending on the options there, you can have them sit before or after your explicit rules (or “last”, before the implicit cleanup).

The implicit cleanup is the default action for any traffic that doesn’t match an explicit or implied rule, and it’s usually set to Drop.

Q7

Rule order matters because firewalls read the rulebase from top to bottom and the first rule that matches the traffic decides the action.

if a broad rule sits above a more specific one, it can catch the traffic first and the specific rule never gets evaluated.

Example
if I put an Allow rule for all traffic above a rule that blocks access to a particular network, the Allow rule matches first, so the block rule does nothing.

Q8

Saving only changes within the administrator's current session while commit changes to the Security Management Server database.

What happens to unpublished changes when installing a policy?

Answer: Unpublished changes are not automatically installed

Why do organisations publish during change windows?

Answer: Maintain change control and approval procedures

Q11)

it blocks legitimate administrators from accessing the firewall because traffic hits this rule first and bypasses the Stealth Rule. It also exposes the firewall and network to unauthorized external access.

You correct the issue by moving the rule below the Stealth Rule or delete it if it was a mistake.

Q12)

NAT saves public IP addresses by letting many private devices share one or many public IPs

NAT Hides internal network details from the outside internet for better security.
